Bro Cheat Sheet

Startup

```
bro [options] [file ...]
```

`file` ....Bro policy script or `stdin`
`-e code` ....Augment policies by given code
`-h` .... Display command line options
`-i iface` .... Read from given interface
`-p pfx` ....Add given prefix to policy resolution
`-r file` ....Read from given PCAP file
`-w file` ....Write to given file in PCAP format
`-x file` .... Print contents of state file
`-C` ....Ignore invalid checksum

Language

Lowercase letters represent instance variables and uppercase letters represent types. In general, x is an instance of type T and y an instance of type U. Argument names and record fields begin begin with a, b, . . . , and z represents a default instance variable which takes on the type of the right-hand side expression. For notational convenience, x can often be replaced with an expression of type T.

Variables

Constant qualifier ....`const`
Constant redefinition ....`redef x op expr`
Scope qualifier ....`local`, `global`
Declaration ....`scope x: T`
Declaration & Definition ....`scope z = expr`

Declarations

Type ....`type name: T`
Function ....`function f(a: T, ...): R`
Event ....`event e(a: T, ...)`

Modules

Script import ....`@load path`
Set current namespace to `ns` ....`module ns`
Export global symbols ....`export { ... }`
Access `module` or `enum` namespace ....`T::a`

Statements

Basic statement ....`stmt;` or `expr;`
Code block ....`{ stmt; ... }`
Assignment ....`z = expr`
Function assignment ..`z = function(...): R {..}`
Event queuing ....`event e(...)`
Event scheduling ...`schedule 10 secs { e(...) }`
Print expression to `stdout` ....`print expr`

Branching	Iteration	Control
`if (expr)`	`for (i in x)`	`break`
`    { ... }`	`    { ... }`	`continue`
`else if (expr)`		`next`
`    { ... }`	**Asynchronous**	`return`
`else`	`when (expr) { ... }`	
`    { ... }`	`when (local x = expr) { ... }`	

Expressions

Operators

`!` ....Negation
`$, ?$` .... Dereference, record field existence
`+, -, *, /, %` ....Arithmetic
`++, --` .... Post-increment, post-decrement
`+=, -=, *=, /=` .... Arithmetic and assignment
`==, !=` .... Equality, inequality
`<, <=, >=, >` .... Less/greater than (or equal)
`&&, ||` ....Conjunction, disjunction
`in, !in` ....Membership or pattern matching
`[x]` .... Index strings and containers
`|x|` ...... Cardinality/size for strings and containers
`f(...)` ....Function call
`expr ? expr : expr` .... Ternary if-then-else

Types

Basic

`addr` .... IP address (`127.0.0.1`)
`bool` ....Boolean flag (`T`, `F`)
`count` ....64-bit unsigned integer (`42`)
`double` ....Double-precision floating point (`99.9`)
`int` ....64-bit signed integer (`-7`)
`interval` ....Time interval (`8 sec/min/hr/day[s]`)
`pattern` ....Regular expression (`/^br[oO])$/`)
`port` .... Transport-layer port (`22/tcp`, `53/udp`)
`string` ....String of bytes (`"foo"`)
`subnet` ....CIDR subnet mask (`10.0.0.0/8`)
`time` .... Absolute epoch time (`1320977325`)

Enumerables

Declaration ....`enum { FOO, BAR }`
Assignment ....`scope x = FOO`

Records

Declaration ....`record { a: T, b: U, ... }`
Constructor ....`record($a=x, $b=y, ...)`
Assignment ....`scope r = [$a=x, $b=y, ...]`
Access ....`z = r$a`
Field assignment ....`r$b = y`
Deletion ....`delete r$a`

Sets

Declaration ....`set[T]`
Constructor ....`set(x, ...)`
Assignment ....`scope s = { x, ... }`
Access ....`z = s[x]`
Insertion ....`add s[x]`
Deletion ....`delete s[x]`

Tables

Declaration ....`table[T] of U`
Constructor ....`table([x] = y, ...)`
Assignment ....`scope t = { [x] = y, ... }`
Access ....`z = t[x]`
Insertion ....`t[x] = y`
Deletion ....`delete t[x]`

Vectors

Declaration ....`vector of T`
Constructor ....`vector(x, ...)`
Assignment ....`scope v = { x, ... }`
Access ....`z = v[0]`
Insertion ....`v[42] = x`

Attributes

Attributes occur at the end of type/event declarations and change their behavior. The syntax is `&key` or `&key=val`, e.g., `type T: set[count] &read_expire=5min` or `event foo() &priority=-3`.

`&optional` . . . . Allow record field to be missing
`&default=x` . . . . Use default value x for record fields and container elements
`&redef` . . . . Allow for redefinition of initial object value
`&expire_func=f` . . . . Call f right before container element expires
`&read_expire=x` . . . . Remove element after not reading it for time x
`&write_expire=x` . . . . Remove element after not writing it for time x
`&create_expire=x` . . . . Remove element after time x from insertion
`&persistent` . . . . Write state to disk (per default on shutdown)
`&synchronized` . . . . Synchronize variable across nodes
`&raw_output` . . . . Do not escape non-ASCII characters when writing to a file
`&mergeable` . . . . Prefer set union to assignment for synchronized state
`&priority=x` . . Execution priority of event handler, higher values first, default 0
`&group="x"` . . . . . . Events in the same group can be jointly activated/deactivated
`&log` . . . . Write record field to log

Built-In Functions (BIFs)

Core

- `getenv(var: string): string`
  Returns the system environment variable identified by `var`.
- `setenv(var: string, val: string): bool`
  Sets the system environment variable `var` to `val`.
- `exit()` Shuts down the Bro process immediately.
- `terminate(): bool` Gracefully shut down Bro by terminating outstanding processing. Returns true after successful termination and false when Bro is still in the process of shutting down.
- `system(s: string): int`
  Invokes a command via the `system` function. Returns true if the return value of `system` was non-zero.
- `system_env(s: string, env: any): int`
  Same as `system`, but prepare the environment before invoking the command `s` with the set/table `env`.
- `srand(seed: count)`
  Set the seed for subsequent `rand` calls.
- `rand(max: count): count`
  Returns a random value from the interval $[0, \text{max})$.

- `md5_hash(...): string`
  Computes the MD5 hash value of the provided list of arguments.
- `md5_hash_init(index: any): bool`
  Initializes MD5 state for `index` to allow for computing hash values incrementally via the function `md5_hash_update`. For example, when computing incremental MD5 values of transferred files in multiple concurrent HTTP connections, it is necessary to call `md5_hash_init(c$id)` once before invoking `md5_hash_update(c$id, some_more_data)` in the `http_entity_data` event handler.
- `function md5_hash_update(index: any, data: string): bool`
  Update the MD5 value associated with `index`. Note that it is necessary to call `md5_hash_init(index)` once before calling this function to initialize the MD5 state.
- `md5_hash_finish(index: any): string`
  Returns the final MD5 digest associated with the internal state identified by `index`.
- `md5_hmac(...): string`
  Computes an HMAC-MD5 hash value of the provided list of arguments. The HMAC secret key is generated from available entropy when Bro starts up, or it can be specified for repeatability using the new `-K` flag.
- `clear_table(v: any`
  Removes all elements from the set or table `v`.

Introspection

- `current_time(): time`
  Returns the current wall-clock time.
- `network_time(): time`
  Returns the timestamp of the last packet processed.
- `reading_live_traffic(): bool`
  Checks whether Bro reads traffic from a network interface (as opposed to from a network trace).
- `reading_traces(): bool`
  Checks whether Bro reads traffic from a trace file (as opposed to from a network interface).
- `net_stats(): NetStats`
  Returns statistics about the number of packets *(i)* received by Bro, *(ii)* dropped, and *(iii)* seen on the link (not always available).
- `resource_usage(): bro_resources`
  Returns Bro process statistics, such as real/user/sys CPU time, memory usage, page faults, number of TCP/UDP/ICMP connections, timers, and events queued/dispatched.
- `get_matcher_stats(): matcher_stats`

Returns statistics about the regular expression engine, such as the number of distinct matchers, DFA states, DFA state transitions, memory usage of DFA states, cache hits/misses, and average number of NFA states across all matchers.

- `get_gap_summary(): gap_info`
  Returns statistics about TCP gaps.

- `same_object(o1: any, o2: any): bool`
  Checks whether `o1` and `o2` reference the same internal object.

- `length(v: any): count`
  Returns the number of elements in the container `v`.

- `val_size(v: any): count`
  Returns the number bytes that `v` occupies in memory.

- `global_sizes(): table[string] of count`
  Returns a table containing the size of all global variables, where the index is the variable name and the value the variable size in bytes.

- `global_ids(): table[string] of script_id`
  Returns a table with information about all global identifiers. The table value is a record containing the type name of the identifier, whether it is exported, a constant, an enum constant, redefinable, and its value (if it has one).

- `record_fields(r: any): table[string] of record_field`
  Returns meta data about a record instance `r`, which includes the type name, whether the field is logged, its value (if it has one), and its default value (if specified).

Analyzer Behavior

- `skip_further_processing(id: conn_id): bool`
  Stops processing packets belonging to the connection identified by `id`. Returns false if `id` does not point to an active connection and true otherwise. Note that this does not in itself imply that packets from this connection will not be recorded, which is controlled separately by `set_record_packets`.

- `set_record_packets(id: conn_id, do_record: bool): bool`
  Controls whether packet contents belonging to the connection identified by `id` should be recorded (when `-w out.pcap` is provided on the command line). Note that this is independent of whether Bro processes the packets of this connection, which is controlled separately by `skip_further_processing`.

- `set_contents_file(id: conn_id, direction: count, f: file): bool`
  Associates the file handle `f` with the connection identified by `id` for writing TCP byte stream contents. The argument `direction` controls what sides of the connection contents are recorded; it can take on four values: `CONTENTS_NONE` to turn off recording of contents, `CONTENTS_ORIG` to record originator contents, `CONTENTS_RESP` to record responder contents, and `CONTENTS_BOTH` to record both originator and responder contents. Returns false if `id` does not point to an active connection and true otherwise.

- `get_contents_file(id: conn_id, direction: count): file`
  Returns the file handle associated with the connection identified by `id` and `direction`. If the connection exists but no contents file for `direction`, the function returns a handle to new file. If not active connection for `id` exists, it returns an error.

- `skip_http_entity_data(c: connection, is_orig: bool)`
  Skips the data of the HTTP entity in the connection `c`. If `is_orig` is true, the client data is skipped and the server data otherwise.

- `skip_smtp_data(c: connection)`
  Skips SMTP data until the next email in `c`.

String Processing

- `byte_len(s: string): count`
  Returns the number of characters (i.e., bytes) of `s`.

- `sub_bytes(s: string, start: count, n: int): string`
  Get a substring of `s`, starting at position `start` and having length `n`.

- `split(s: string, re: pattern): table[count] of string`
  Split `s` into an array using `re` to separate the elements. The returned table starts at index 1. Note that conceptually the return value is meant to be a vector and this might change in the future.

- `split1(s: string, re: pattern): table[count] of string`
  Same as `split`, but `s` is only split once (if possible) at the earliest position and an array of two strings is returned. An array of one string is returned when `s` cannot be split.

- `split_all(s: string, re: pattern): table[count] of string`
  Same as `split`, but also include the matching separators, e.g., `split_all("a-b--cd", /(\-)+/)` returns `{"a", "-", "b", "--", "cd"}`. Odd-indexed elements do not match the pattern and even-indexed ones do.

- `split_n(s: string, re: pattern, incl_sep: bool, max_num_sep: count): table[count] of string`
  Similar to `split1` and `split_all`, but `incl_sep` indicates whether to include matching separators and `max_num_sep` the number of times to split `s`.

- `sub(s: string, re: pattern, repl: string): string`
  Substitutes `repl` for the first occurrence of `re` in `s`.

- `gsub(s: string, re: pattern, repl: string): string`
  Same as `sub` except that all occurrences of `re` are replaced.

- `strcmp(s1: string, s2: string): int` Lexicographically compare `s1` and `s2`. Returns an integer greater than, equal to, or less than 0 according as `s1` is greater than, equal to, or less than `s2`.

- `strstr(big: string, little: string): count`
  Locate the first occurrence of `little` in `big`. Returns 0 if `little` is not found in `big`.

- `subst_string(s: string, from: string, to: string): string`
  Substitute each (non-overlapping) appearance of `from` in `s` to `to`, and return the resulting string.
- `to_lower(s: string): string`
  Returns a copy of `s` with each letter converted to lower case.
- `to_upper(s: string): string`
  Returns a copy of `s` with each letter converted to upper case.
- `clean(s: string): string`
  Replace non-printable characters in `s` with escaped sequences, with the mappings `NUL` $\to$ `\0`, `DEL` $\to$ `^?`, values $\leq 26 \to$ `^[A-Z]`, and values not in $[32, 126] \to$ `%XX`.
- `to_string_literal(s: string): string`
  Same as clean, but with different mappings: values not in $[32, 126] \to$ `%XX`, `\` $\to$ `\\`, `'` $\to$ `\'`, `"` $\to$ `\"`.
- `is_ascii(s: string): bool`
  Returns false if any byte value of `s` is greater than 127, and true otherwise.
- `escape_string(s: string): string`
  Returns a printable version of `s`. Same as `clean` except that non-printable characters are removed.
- `string_to_ascii_hex(s: string): string`
  Returns an ASCII hexadecimal representation of a string.
- `str_split(s: string, idx: vector of count): vector of string`
  Splits `s` into substrings, taking all the indices in `idx` as cutting points; `idx` does not need to be sorted and out-of-bounds indices are ignored.
- `strip(s: string): string`
  Strips whitespace at both ends of `s`.
- `string_fill(len: int, source: string): string`
  Generates a string of size `len` and fills it with repetitions of `source`.
- `str_shell_escape(source: string): string`
  Takes a string and escapes characters that would allow execution of commands at the shell level. Must be used before including strings in `system` or similar calls.
- `find_all(s: string, re: pattern) : set of string`
  Returns all occurrences of `re` in `s` (or an empty empty set if none).
- `find_last(s: string, re: pattern) : string`
  Returns the last occurrence of `re` in `s`. If not found, returns an empty string. Note that this function returns the match that starts at the largest index in the string, which is not necessarily the longest match. For example, a pattern of `/.*/` will return the final character in the string.
- `hexdump(data: string) : string`
  Returns a hex dump for `data`. The hex dump renders 16 bytes per line, with hex on the left and ASCII (where printable) on the right. Based on Netdude's hex editor code.

Math

- `floor(x: double): double`
  Chops off any decimal digits of `x`, i.e., computes $\lfloor x \rfloor$.
- `sqrt(x: double): double`
  Returns the square root of `x`, i.e., computes $\sqrt{x}$.
- `exp(x: double): double`
  Raises e to the power of `x`, i.e., computes e^x.
- `ln(x: double): double`
  Returns the natural logarithm of `x`, i.e., computes $\ln x$.
- `log10(x: double): double`
  Returns the common logarithm of `x`, i.e., computes $\log_{10} x$.

Conversion

- `cat(...): string`
  Concatenates all given arguments into a single string.
- `cat_sep(sep: string, default: string, ...): string`
  Similar to cat, but places `sep` between each given argument. If any of the variable arguments is an empty string it is replaced by `default` instead.
- `fmt(...): string`
  Produces a formatted string. The first argument is the *format string* and specifies how subsequent arguments are converted for output. It is composed of zero or more directives: ordinary characters (not `%`), which are copied unchanged to the output, and conversion specifications, each of which fetches zero or more subsequent arguments. Conversion specifications begin with `%` and the arguments must properly correspond to the specifier. After the `%`, the following characters may appear in sequence:

`%`	Literal `%`
`-`	Left-align field
`[0-9]+`	The field width (< 128)
`.`	Precision of floating point specifiers `[efg]` (< 128)
`A`	Escape NUL bytes, i.e., replace `0` with `\0`
`[DTdxsefg]`	Format specifier

`[DT]`	ISO timestamp with microsecond precision
`d`	Signed/Unsigned integer (using C-style `%lld`/`%llu` for `int`/`count`)
`x`	Unsigned hexadecimal (using C-style `%llx`); addresses/ports are converted to host-byte order
`s`	Escaped string
`[efg]`	Double

- `type_name(t: any): string`
  Returns the type name of `t`.

- `record_type_to_vector(rt: string): vector of string`
  Converts the record type name `rt` into a vector of strings, where each element is the name of a record field. Nested records are flattened.
- `to_int(s: string): int`
  Converts a `string` into a (signed) integer.
- `int_to_count(n: int): count`
  Converts a positive integer into a `count` or returns 0 if `n < 0`.
- `double_to_count(d: double): count`
  Converts a positive `double` into a `count` or returns 0 if `d < 0.0`.
- `to_count(s: string): count`
  Converts a `string` into a `count`.
- `interval_to_double(i: interval): double`
  Converts an `interval` time span into a `double`.
- `double_to_interval(d: double): interval`
  Converts a `double` into an `interval`.
- `time_to_double(t: time): double`
  Converts a `time` value into a `double`.
- `double_to_time(d: double): time`
  Converts a `double` into a `time` value.
- `double_to_time(d: double): time`
  Converts a `double` into a `time` value.
- `port_to_count(p: port): count`
  Returns the port number of `p` as `count`.
- `count_to_port(c: count, t: transport_proto): port`
  Creates a `port` with number `c` and transport protocol `t`.
- `to_port(s: string): port`
  Converts a `string` into a `port`.
- `addr_to_count(a: addr): count`
  Converts an IP address into a 32-bit unsigned integer.
- `count_to_v4_addr(ip: count): addr`
  Converts an unsigned integer into an IP address.
- `to_addr(ip: string): addr`
  Converts a `string` into an IP address.
- `raw_bytes_to_v4_addr(b: string): addr`
  Converts a `string` of bytes into an IP address. It interprets the first 4 bytes of `b` as an IPv4 address in network order.
- `ptr_name_to_addr(s: string): addr`
  Converts a reverse pointer name to an address, e.g., `1.0.168.192.in-addr.arpa` to `192.168.0.1`.
- `addr_to_ptr_name(a: addr): string`
  Converts an IP address to a reverse pointer name, e.g., `192.168.0.1` to `1.0.168.192.in-addr.arpa`.

- `parse_dotted_addr(s: string): addr`
  Converts a decimal dotted IP address in a string to an address type.
- `parse_ftp_port(s: string): ftp_port`
  Converts a string representation of the FTP PORT command to an `ftp_port`, e.g., `"10,0,0,1,4,31"` to `[h=10.0.0.1, p=1055/tcp, valid=T]`
- `parse_eftp_port(s: string): ftp_port`
  Same as as `parse_ftp_port`, but instead for EPRT (see RFC 2428) whose format is `EPRT<space><d><net-prt><d><net-addr><d><tcp-port><d>`, where `<d>` is a delimiter in the ASCII range 33-126 (usually |).
- `parse_ftp_pasv(s: string): ftp_port`
  Converts the result of the FTP PASV command to an `ftp_port`.
- `parse_ftp_epsv(s: string): ftp_port`
  Same as `parse_ftp_pasv`, but instead for the EPSV (see RFC 2428) whose format is `<text> (<d><d><d><tcp-port><d>)`, where `<d>` is a delimiter in the ASCII range 33-126 (usually |).
- `fmt_ftp_port(a: addr, p: port): string`
  Formats the IP address `a` and TCP port `p` as an FTP PORT command, e.g., `10.0.0.1` and `1055/tcp` to `"10,0,0,1,4,31"`.
- `decode_netbios_name(name: string): string`
  Decode a NetBIOS name, e.g., `"FEEIEFCAEOEFFEECEJEPFDCAEOEBENEF"` to `"THE NETBIOS NAME"`.
- `decode_netbios_name_type(name: string): count`
  Converts the NetBIOS name type to the corresponding numeric value.
- `bytestring_to_hexstr(bytestring: string): string`
  Converts a string of bytes into its hexadecimal representation, e.g., `"04"` to `"3034"`.
- `decode_base64(s: string): string`
  Decode the Base64-encoded string `s`.
- `decode_base64_custom(s: string, a: string): string`
  Decode the Base64-encoded string `s` with alphabet `a`.

Network Type Processing

- `mask_addr(a: addr, top_bits_to_keep: count): subnet`
  Creates a subnet mask from `a` by specifying the number of top bits to keep. For example, `mask_addr(10.5.1.3, 8)` would return `10.0.0.0/8`.
- `remask_addr(a1: addr, a2: addr, top_bits_from_a1: count): count`
  Takes some top bits (e.g., subnet address) from `a1` and the other bits (intra-subnet part) from `a2` and merge them to get a new address. This is useful for anonymizing at subnet level while preserving serial scans.
- `is_tcp_port(p: port): bool`
  Checks whether `p` is a TCP port.
- `is_udp_port(p: port): bool`

Checks whether p is a UDP port.

- `is_icmp_port(p: port): bool`
  Checks whether p is an ICMP port.
- `connection_exists(id: conn_id): bool`
  Checks whether the connection identified by id is (still) active.
- `lookup_connection(id: conn_id): connection`
  Returns the `connection` record for id. If id does not point to an existing connection, the function returns a run-time error and returns a dummy value.
- `get_conn_transport_proto(id: conn_id): transport_proto`
  Returns the transport protocol of the connection identified by id. As with `connection_record`, id must point to an active connection.
- `get_port_transport_proto(p: port): transport_proto`
  Returns the transport protocol of p.
- `set_inactivity_timeout(id: conn_id, t: interval): interval`
  Sets an individual inactivity timeout for the connection identified by id (overrides the global inactivity timeout). Returns the previous timeout interval.
- `get_login_state(id: conn_id): count`
  Returns the login state of the connection identified by id. Returns false if id is not an active connection or does not tagged as login analyzer. Otherwise the function returns the login state as a `count`.
- `set_login_state(id: conn_id, new_state: count): bool`
  Sets the login state of the connection identified by id to `new_state`. Returns false if id is not an active connection or does not tagged as login analyzer, and true otherwise.
- `get_resp_seq(id: conn_id): count`
  Returns the responder TCP sequence number of the connection identified by id. If the connection is not active or not TCP, it returns 0.
- `unescape_URI(URI: string): string`
  Unescapes all characters in URI, i.e., decodes every `%xx` group.

Files and Directories

- `open(f: string): file`
  Opens the file identified by f for writing. Returns a handle for subsequent file operations.
- `open_for_append(f: string): file`
  Same as `open`, except that f is not overwritten and content is appended at the end of the file.
- `close(f: file): bool`
  Closes the file handle f and flushes buffered content. Returns true on success.
- `active_file(f: file): bool`
  Checks whether f is open.
- `write_file(f: file, data: string): bool`
  Writes `data` to f. Returns true on success.
- `get_file_name(f: file): string`
  Returns the filename associated with f.
- `set_buf(f: file, buffered: bool)`
  Alters the buffering behavior of f. When `buffered` is true, the file is fully buffered, i.e., bytes are saved in a buffered until the block size has been reached. When `buffered` is false, the file is line buffered, i.e., bytes are saved up until a newline occurs.
- `flush_all(): bool`
  Flushes all open files to disk. Returns true when the operations(s) succeeded.
- `mkdir(f: string): bool`
  Creates a new directory identified by f. Returns true if the operation succeeded and f does not exist already.
